

Macro-averaged over trajectories (verdict definition); a trajectory is excluded from a metric only where that metric is undefined. Sequential scale, 0–60% clipped: one cell exceeds it (qwen3-8B × inventory, 100.0 on 3 trajectories). Hatched cells rest on fewer than 5 trajectories with a defined HAR and print that count. Columns ordered by pooled HAR. AppWorld drops an unlabelled domain (0 defined) and supervisor (1).
